

Soil Test Report

Agricultural & Environmental Testing Laboratory
and UVM Extension

Prepared For:

Michael Ware
152 Home Ave
Burlington, VT 05401

michaelware1205@gmail.com
802 881-9157

Sample Information:

Order #: 15518
Lab ID: S23-03000
Raised Bed #5

Area Sampled: 30 sq ft
Received: 8/2/2023
Reported: 8/7/2023
VT County: Chittenden

Results

Nutrient	Very Low	Low	Medium	High	Excessive
Phosphorus (P): 366.4					
Potassium (K): 193					
Magnesium (Mg): 715					

Phosphorus is excessive! High levels pose a risk to water quality but are not a danger to human health.

Analysis	Value Found	Optimal Range (for most crops)
Soil pH (2:1, water)	7.5	6-7
Modified Morgan extractable, ppm		
Phosphorus (P)	366.4	10-15
Potassium (K)	193	100-130
Calcium (Ca)	5985	>1000 *
Magnesium (Mg)	715	50-100
Soil Organic Matter %	17.5	*
CEC, meq/100g	36.4	*

Analysis	Value Found	Typical Ranges in VT (ppm)**
Iron (Fe)	3.6	2.4-10.6
Manganese (Mn)	27.1	2.1-9.3
Boron (B)	1.7	0.10-0.60
Copper (Cu)	0.1	0.16-0.30
Sulfur (S)	17.0	5-17
Zinc (Zn)	6.2	0.4-3.2
Sodium (Na)	54.0	6-21
Aluminum (Al)	3	8-107

* Ca content, organic matter %, and CEC are dependent on soil texture. They tend to be high in soils with a lot of clay and low in soils with a lot of sand.

** Ranges shown represent 90% of > 7000 recent soil test results. Micronutrient deficiencies are rare in VT when soil pH is in the optimal range. Al and Na are not nutrients but are shown because at high levels they can cause plant toxicity.

Agricultural & Environmental Testing Laboratory
and UVM Extension

Recommendations for Home Vegetable (mixed) (HMITX)

Home

Limestone (Target pH of 6.8)	Nitrogen	Phosphate, P2O5	Potash, K2O
lbs / 1000 sq ft 0	lbs / 1000 sq ft 3	lbs / 1000 sq ft 0	lbs / 1000 sq ft 0

Comments:

Soil tests normally do not measure nitrogen because its availability changes rapidly depending on temperature, moisture and microbial activity. Instead, N application rates are based on plant uptake needs. See enclosed fact sheet for more information.

If your micronutrients are low, the addition of compost or a volcanic material such as Azomite may be beneficial.

To convert fertilizer or lime pounds per acre to pounds per 1,000 sq ft, divide by 40; for lb per 100 sq ft, divide lb per acre by 400

Soil test values for phosphorus and potassium are above optimum. Only a source of nitrogen is necessary this year.

Your soil pH is above optimum for most crops. It may go down on its own over time; to reduce pH more quickly, apply elemental sulfur (S) at a rate of 400 lb./acre.

For guidance on fertilizer options and rates, see the tables in the references below.
